Map shows allocation of lands to Fire Management Categories A through D under Alternative D.

Category A: Wildland fire is not desired in these areas. The fire management emphasis should be placed on prevention, detection, rapid response, use of appropriate suppression techniques and tools, and non-fire fuels treatment.

Category B: Areas where unplanned fire is likely to cause negative effects, but these effects can be mitigated or avoided through fuels management (e.g., prescribed fire), prevention of human caused fire, or other strategies.

Category C: Areas where fire is desired to manage ecosystems but there are significant constraints that must be considered for its use. These constraints could include critical wildlife habitat, air quality or T&E species. Resource considerations could be described in terms of maximum acreage, time of year or as burned acres per decade from all types of fire.

Category D: Areas where fire is desired, and where there are no constraints associated with resource conditions or social, economic, or political considerations (i.e., where natural and management ignited fire may be used to achieve desired objectives, such as to improve vegetation or watershed conditions.
